Combating Ocean Pollution and Marine Ecosystem Destruction

Ms. Prabhleen Kaur
MBA 2nd Year

Ocean pollution and marine ecosystem destruction threaten biodiversity, food security, and climate stability. Plastic waste, oil spills, chemical runoff, and overfishing endanger marine life and disrupt ecosystems. Governments and organizations must enforce strict regulations on waste disposal, promote sustainable fishing, and invest in marine conservation efforts.

Public awareness and community-driven initiatives, such as beach clean-ups and reduced plastic usage, play a vital role in protecting oceans. Advancing eco-friendly technologies and global cooperation can help restore marine habitats. Urgent action is needed to preserve the oceans, ensuring a balanced environment for future generations.
