Addressing Malnutrition and Hunger Among Children

Mr. Sonu Kumar
B.Tech ME 4th Year

Malnutrition and hunger affect millions of children worldwide, leading to stunted growth, weakened immunity, and impaired cognitive development. Poverty, food insecurity, and lack of access to nutritious meals are major contributors. Governments and NGOs must implement school meal programs, improve agricultural practices, and ensure food distribution reaches vulnerable communities.

Educating parents about nutrition and supporting breastfeeding can help prevent early childhood malnutrition. Public-private partnerships can enhance food production and accessibility. Urgent global efforts are needed to eliminate child hunger, ensuring that every child receives the nourishment necessary for a healthy and productive future.
